

How To Play The Recorder

Introduction: Why the Recorder Remains a Timeless First Instrument

For generations, the recorder has served as the gateway instrument for millions of budding musicians. Its affordability, portability, and relatively gentle learning curve make it an excellent choice for children and adults alike. Yet, despite its reputation as a simple classroom tool, the recorder is a serious instrument with a rich history dating back to the medieval period. Mastering **how to play the recorder** goes far beyond producing a few squeaky notes; it opens the door to understanding breath control, finger dexterity, and musical phrasing. Whether you are a complete beginner picking up a recorder for the first time or a parent hoping to guide a child through their first musical adventure, this guide will provide a clear, step-by-step roadmap. We will cover everything from assembling your instrument and producing your first clear tone to

playing your first complete song and developing good practice habits. By the end of this article, you will have a solid foundation and the confidence to continue your musical journey.

Choosing Your First Recorder

Before you can learn **how to play the recorder**, you need the right tool. While all recorders share basic design principles, not all are created equal. The type of recorder you choose will significantly impact your early experience.

Soprano Recorder: The Standard Starting Point

The soprano recorder is the most common instrument for beginners. It is small, lightweight, and typically pitched in C. When people refer to a "school recorder," this is almost always what they mean. Soprano recorders are ideal for learning basic fingerings and are the most affordable option. They are perfect for children

aged six and up, as well as for adults with smaller hands.

Alto Recorder: A Richer Alternative

The alto recorder is slightly larger and pitched in F, giving it a warmer, fuller sound. Many music educators argue that the alto is actually a better starting point for older beginners and adults because its spacing between finger holes is more comfortable for larger hands. However, its fingering system is different from the soprano, so if you plan to eventually play both, starting with soprano is generally recommended. If your goal is to play Renaissance or Baroque music, the alto is a fantastic long-term choice.

Other Types of Recorders

Once you progress beyond the beginner stage, you may encounter tenor, bass, and sopranino recorders. These are more specialized instruments used in consort playing. For a first instrument, stick with a high-quality soprano or alto recorder. Avoid the cheapest plastic models, as they often have poor tone and are difficult to play in tune. A mid-range plastic recorder (like those made by Yamaha or Aulos) is very reliable and will serve you well for months or even years.

The Anatomy of a Recorder

Understanding the parts of your instrument is an essential step in learning **how to play the recorder**. The recorder is typically made of three separate sections that fit together:

- **The Headjoint:** This top section contains the mouthpiece (also called the beak) and the window (or labium). This is where your breath creates the sound.
- **The Body:** The middle section contains most of the finger holes. This is where your left hand will primarily operate.
- **The Footjoint:** The bottom section has one or two holes and is usually rotated slightly for comfort. Your right hand controls this section.

When assembling your recorder, gently twist the sections together with a slight turning motion. Never push them straight in, as this can damage the cork or plastic joints. Align the center of the mouthpiece with the center of the first finger hole on the body.

Holding the Recorder Correctly

Proper posture and hand position are critical for producing a good sound and avoiding tension. Many beginners struggle simply because they hold the

instrument incorrectly.

Posture

Sit or stand with a straight back. Imagine a string pulling gently from the top of your head. Keep your shoulders relaxed and your elbows away from your body. The recorder should be held at a 45-degree angle downward from your mouth. Do not tilt your head back or hunch your shoulders forward.

Left Hand Position

The left hand is always on top. Your left thumb covers the single hole on the back of the recorder. Your left index, middle, and ring fingers cover the top three holes on the front. Your left pinky rests gently on the side of the recorder.

Right Hand Position

Your right hand supports the bottom of the recorder. Your right thumb rests on the back of the recorder, about halfway down the body. Your right index, middle, ring, and pinky fingers cover the bottom four holes. Do not use your right thumb to support all the weight; this creates tension. The weight should be balanced between your left thumb and your right thumb.

Producing Your First Sound: The Art of Breath

The most common frustration for beginners is producing a clear, pleasant tone. The secret lies in your breath. The recorder is remarkably sensitive to air speed and volume.

The "Too" Syllable

To start a note cleanly, articulate with the syllable "too" (or "doo" for a softer sound). Place the mouthpiece between your lips, not behind your teeth. Seal your lips gently around the beak. Do not bite down. Now, say "too" into the instrument using a gentle, steady stream of air. The sound should be clear and pure.

Avoiding Common Sound Problems

- **Squeaking or Overblowing:** This happens when you blow too hard. Reduce your air pressure. The recorder requires a gentle, focused breath, not a forceful blast.
- **Airy or Weak Sound:** This happens when you do not blow enough air or when your lip seal is broken. Ensure your lips are sealed completely around the mouthpiece and increase your air support slightly.
- **No Sound at All:** Check that your tongue is not

blocking the windway. Make sure the window (the hole on the top of the headjoint) is not covered by your fingers or lips.

Practice producing a steady, clear tone on just the headjoint before you assemble the entire recorder. This focused practice will train your ear and your breath control.

Learning Your First Notes

Once you can produce a consistent sound, it is time to learn fingerings. The recorder has a relatively logical fingering system. Let us start with notes from the lower register.

The Note B (Left Hand Only)

Cover the thumb hole on the back with your left thumb. Cover the top front hole with your left index finger. Leave all other holes open. Blow gently. This is the note B. Practice transitioning from a rest to a clear B.

The Note A

From B, simply add your left middle finger to the second front hole. This is A. Practice moving between B and A. Listen to the pitch difference.

The Note G

From A, add your left ring finger to the third front hole. This is G. You are now covering the thumb hole and the top three holes. Congratulations, you have just played a G major arpeggio (G, A, B).

Introducing the Right Hand: The Note C and D

For lower notes, you will need your right hand. For the note C (one octave above middle C), cover the thumb hole and the second front hole with your left middle finger. Now, add your right index finger to the fourth front hole (the first hole your right hand controls). Leave all other holes open. This is a reliable C.

For D, cover the thumb hole and the second front hole. Leave everything else open. Practice moving between these notes using your tongue to articulate each one clearly.

Reading Basic Recorder Music (Tablature and Standard Notation)

Part of learning **how to play the recorder** involves understanding how to read music. Many beginner books

use simplified notation.

Recorder Finger Charts

A **recorder fingering chart** shows you which holes to cover for each note. The chart usually pictures the recorder from the back (showing the thumb hole) and the front (showing the finger holes). Filled-in circles mean the hole is covered; open circles mean it is uncovered. Keep a fingering chart handy as you practice.

Standard Musical Notation

While finger charts are helpful, learning to read standard notation is invaluable. Recorder music is usually written in treble clef. Notes on the lines (E, G, B, D, F) and spaces (F, A, C, E) correspond to specific fingerings. Start with simple songs that use only a few notes, like "Hot Cross Buns" (which uses B, A, and G) or "Mary Had a Little Lamb." These songs reinforce your fingerings and your sense of rhythm.

Essential Techniques for a Better Sound

Once you can play a few notes, refine your technique. These skills separate a beginner from someone who truly knows **how to play the recorder**.

Articulation: Tonguing vs. Slurring

Articulation refers to how you start and separate notes. Using the "too" syllable is called **tonguing**. It gives each note a clear, defined beginning. You can also **slur** notes, which means playing two or more notes in one breath without tonguing between them. Practice scales by tonguing each note separately, then practice the same scale by slurring groups of two or three notes. This builds flexibility.

Breath Support and Dynamics

The recorder can play both loud and soft, but the range is subtle. To play louder, increase your air speed while keeping your embouchure (lip position) firm. To play softer, decrease air speed. The challenge is maintaining a steady pitch while changing volume. Practice playing a single note, like G, starting very softly and gradually getting louder (crescendo), then gradually getting softer (decrescendo). This is called a **mess di voce** and is excellent for developing control.

Finger Placement and Curvature

Always cover the holes with the pads of your fingers, not the tips. Your fingers should be slightly curved, as if you were holding a small ball. Flat fingers create air leaks. Lift your fingers only a fraction of an inch off the

holes when changing notes. Excessive lifting slows you down and creates unwanted sounds.

Your First Practice Routine Common Challenges and How to

A structured practice routine is far more effective than random playing. Here is a 10-15 minute routine for beginners:

1. **Warm-up (2 minutes):** Play the headjoint alone. Focus on producing a clear, steady tone for 10 seconds at a time.
2. **Long Tones (3 minutes):** Play the note B, then A, then G. Hold each note for 4-6 seconds, listening carefully to the pitch. Use a tuner app if possible.
3. **Finger Drills (3 minutes):** Slowly play the sequence B-A-G-A-B. Repeat it 5 times. Then try G-A-B-A-G. Focus on keeping your fingers close to the holes.
4. **Song Practice (5 minutes):** Play a simple song like "Hot Cross Buns" or "Merrily We Roll Along." Play it very slowly, aiming for clean articulation between each note.

5. **Cool Down (2 minutes):** Improvise freely using the notes B, A, and G. Make up your own melodies. Have fun with it.

Overcome Them

Every learner faces obstacles. Here is how to address the most common problems encountered when learning **how to play the recorder**.

Squeaking on High Notes

High notes require a tighter, faster airstream and often a slightly different fingering (like pinching the thumb hole half-open for notes above D). If you squeak, you are likely blowing too hard or your thumb is not positioned correctly. Relax and reduce air pressure.

Difficulty Covering Holes

If you
