

Psychic Discoveries Behind The Iron Curtain

The Veil Lifts: Exploring the Psi Phenomenon in the Soviet Bloc

For decades, the vast expanse of the Soviet Union and its satellite states was known as the Iron Curtain—a political, military, and ideological barrier that separated the Eastern Bloc from the West. While the world focused on the space race, nuclear arms, and spycraft, a different kind of investigation was unfolding behind this barrier. This was a realm not of rockets and satellites, but of the human mind. The story of **Psychic Discoveries Behind The Iron Curtain** is a tale of government-funded laboratories, legendary spoon benders, and a relentless, secretive quest to weaponize the intangible.

For many in the West, the concept of psychic phenomena was relegated to the fringes of society—parlor tricks, spiritualist church meetings, and sensationalized tabloid headlines. In the Soviet Union, however, it was treated with a cold, hard, scientific pragmatism. The state did not care about spirituality; it cared about results. If the human mind could influence matter, disrupt electronics, or gather intelligence without physical presence, the KGB wanted to know how to harness it. This pragmatic, often ruthless, approach led to decades of research that would eventually become known to the West through the groundbreaking work of authors like Sheila Ostrander and Lynn Schroeder, whose 1970 book *Psychic Discoveries Behind the Iron Curtain* blew the lid off this clandestine world.

This article delves deep into that history, exploring the key figures, the controversial experiments, and the lingering legacy of a scientific pursuit that was as strange as it was state-sponsored. We will examine how Eastern Bloc researchers differed from their Western counterparts, and why their discoveries continue to fascinate and perplex us today.

The Soviet Mandate: A Psi Arms Race

The foundation of Soviet parapsychology was starkly different from its American or British equivalent. In the West, research into psychic phenomena was often privately funded, linked to religious or spiritual movements, or conducted by academics risking their professional reputations. In the Soviet Union, it was a matter of national security. The prevailing ideology of dialectical materialism did not forbid the study of the mind; it merely demanded a physical explanation. If telepathy was real, it had to be a form of energy—a radio wave of the brain that could be measured, amplified, and directed.

This led to a massive, albeit secret, research program. The Soviets were not looking for proof of life after death or spiritual enlightenment. They were looking for a new weapon. The idea of a "psychotronic" weapon—a device or trained human that could cause heart attacks, scramble computer code, or implant thoughts from a distance—was an irresistible prospect for the intelligence services. This militarized focus gave Soviet research a unique intensity and a disturbing edge. The term "psychotronics" itself was coined in the Eastern Bloc to describe the study of the interaction between living organisms and energy fields, a field that conveniently sidestepped the more mystical connotations of "parapsychology."

One of the most significant hubs of this research was the **Institute of Brain Research in Leningrad** and, later, the secretive laboratories in Novosibirsk (Academgorodok) and Moscow. Under the direction of scientists like Dr. Leonid Vasiliev, a prominent physiologist, experiments were conducted to test the limits of telepathic suggestion. Vasiliev's experiments in the 1930s and 1960s were rigorous by any standard. He used shielded rooms, faraday cages, and distant targets to try and isolate the carrier wave of thought. His work, later published in the West, demonstrated that telepathy did not appear to be blocked by electromagnetic shielding, suggesting a mechanism that transcended conventional physics.

The Stars of the Soviet Psi Program

Behind the bureaucracy and the secret memos, there were people—individuals with extraordinary claims who became the unwitting celebrities of this shadowy world. Their stories are the core of the **Psychic Discoveries Behind The Iron Curtain** narrative.

Nina Kulagina: The Enigma of Psychokinesis

Perhaps the most famous and most controversial figure was Nina Kulagina, a Leningrad housewife who appeared to possess a stunning ability: psychokinesis. In dozens of filmed experiments, often under the watchful eyes of skeptical scientists and KGB handlers, Kulagina could move non-magnetic objects on a table without touching them. She could make a matchbox slide, a raw egg yolk separate from its white inside a glass tank, and even stop the beating heart of a frog (a feat that reportedly required her to be in a state of physical exhaustion and immense strain).

The films of Kulagina were shown in secret to Western researchers and caused a sensation. They are grainy, black-and-white, and often show her straining, sweating, and with a visible pulse in her neck. She exhibited physical side

effects: extreme weight loss during experiments, a racing pulse, and sometimes, a small, unexplained burn mark on her skin near the object she was trying to move. Skeptics argued this was a clever magician's trick using hidden magnets or wires. However, the conditions of the tests—non-metallic objects, sealed glass containers, and the presence of scientists who had the power to ruin her—made simple fraud difficult to prove. For many, the films remain compelling evidence of a real, if poorly understood, phenomenon. Kulagina represented the ultimate Soviet discovery: a raw, untrained talent that could potentially be weaponized.

Wolf Messing: The Psychic Spy

Before Kulagina, there was Wolf Messing. A Polish Jew who fled to the Soviet Union during World War II, Messing was a mentalist of extraordinary repute. His primary skill was telepathic suggestion and "mind reading." His performances were legendary. He claimed to have been tested by Sigmund Freud and Albert Einstein in Vienna. His most famous Soviet feat was a demonstration for Stalin himself. Messing was apparently given a task: to rob a bank using only his mental powers. He reportedly walked into a Moscow bank, handed the teller a blank piece of paper, and mentally suggested it was a withdrawal slip for 100,000 rubles. The teller, entranced, handed over the money. Messing then returned the money to prove the vulnerability of the human mind to psychic suggestion.

Messing was a goldmine for the KGB. He was used to gather information, plant suggestions, and train agents. Unlike Kulagina, Messing was a public figure, a celebrated artist. His true work for the state was hidden behind his stage persona. His legacy is a testament to the practical, intelligence-gathering applications that the Soviets saw in psychic talents. He was less a laboratory specimen and more a field operative, a living demonstration of the power of suggestion taken to its absolute limit.

The Method and The Madness: Unique Research Protocols

The Soviet approach to studying these phenomena was markedly different from the Western parapsychological tradition. Western research, particularly at Duke University under J.B. Rhine, focused on statistical analysis—the Zener card test for telepathy, dice tests for psychokinesis. It was all about probability, the deviation from chance. The Soviets dismissed this as weak and boring. They were interested in **who** was powerful, not **how many** people could score slightly above chance.

Their method was the **field approach**. They treated the psychic as a living generator of a field, much like a magnet or a high-voltage wire. They measured the "psi field" indirectly by its effects. They would monitor the subject's brainwaves (EEG), heart rate (EKG), skin conductance, and muscle tension while they attempted a telepathic or psychokinetic feat. They were looking for the **physiological signature of the psychic state**. This was a crucial insight. Kulagina, for example, showed brainwave activity that looked like a miniature epileptic seizure during her most powerful demonstrations. The Soviets hypothesized that the psychic state was a form of controlled brain dysfunction that unlocked latent energy.

This led to the development of theories that were far ahead of their time. Soviet researchers, such as Dr. Victor Adamenko, proposed that Kulagina's psychokinesis was mediated by bioplasmatic energy, an idea that echoes the more metaphysical concept of "chi" or "prana" but was grounded in Soviet physics. They also experimented with **Kirlian photography**, a technique developed by Semyon and Valentina Kirlian that captured a corona discharge around living objects. They believed this "aura" was a visual representation of the bioplasma, and that it could be used to diagnose illness or detect the energetic state of a psychic. These photographs were used extensively in Soviet research and became an iconic image of the psychic discoveries behind the Iron Curtain.

The Weights of Skepticism and the Fall of the Curtain

It would be irresponsible to discuss this history without acknowledging the immense weight of skepticism that hangs over it. The Soviet system was built on state-sponsored lies, propaganda, and a deep suspicion of individual talent. The KGB had every reason to fake or exaggerate psychic results to fool the West into wasting resources on a wild goose chase. This is known as the "Star Wars" deception strategy: making the enemy believe you have a weapon you do not have, forcing them to spend billions trying to catch up.

There is strong evidence that this happened. The CIA and the US Army (through the Stargate Project) took Soviet psychic claims very seriously, spending over 20 million dollars on their own research program. If the Soviet goal was simply to waste American money and time, it was a brilliant success. Furthermore, many of the star psychics, including Kulagina, were later accused of fraud by former KGB officers after the fall of the Berlin Wall. One officer stated that Kulagina was a "good magician" but not a genuine psychic.

Conversely, the sheer volume of research, the rigor of some of the experiments, and the consistency of the phenomena across multiple subjects and laboratories cannot be easily dismissed. The fall of the Iron Curtain in 1989 opened up some archives, but many documents were destroyed or remain classified. The truth is likely a muddy compromise: a mix of genuine, poorly understood human potential, gross exaggeration for political and intelligence purposes, and outright fraud.

The Enduring Legacy

The story of **Psychic Discoveries Behind The Iron Curtain** is more than just a historical curiosity. It had a profound impact on the modern world. It directly led to the creation of the US Stargate Project, which employed individuals like remote viewer **Ingo Swann** for intelligence gathering. The public awareness of Soviet research, driven by Ostrander and Schroeder's book, ignited a global explosion of interest in parapsychology and the New Age movement of the 1970s and 1980s.

Today, the research has largely been de-classified and forgotten, but its core questions remain unanswered. Is there a form of information transfer that does not rely on the five known senses? Can intention affect matter at a distance? The Soviet attempt to answer these questions was flawed, secretive, and often brutal, but it was also ambitious. They tried to build a science of the impossible using the tools of the 20th century.

Modern research in quantum biology, neuroscience, and consciousness studies is beginning to revisit some of these questions with better tools. The "psi fields" the Soviets sought might one day be understood as a property of quantum coherence in biological systems. We may look back on the strange, secretive work of Kulagina, Messing, and Vasiliev not as a failed Cold War program, but as a desperate, clumsy, and incredibly human attempt to reach for the stars—not with rockets, but with the mind.

Conclusion: A Closed Chapter or an Unread Book?

The history of **Psychic Discoveries Behind The Iron Curtain** is a final, fascinating footnote to the Cold War. It was a time when governments believed that the human mind could be the ultimate weapon, and they poured immense resources into proving it. The results were ambiguous, the experiments controversial, and the legacy complicated.

What remains is a powerful story about the boundaries of science, the pull of the unknown, and the desperate desire for power. Whether Kulagina moved that matchbox with her mind or hidden string is, in some ways, beside the point. The real discovery was the depth of human curiosity and the lengths to which we will go to understand ourselves. The Iron Curtain is gone, the secret labs are silent, and the psychics have passed on. But the questions they raised about the untapped potential of the human mind are as urgent and as mysterious as ever. The book on Soviet parapsychology is not yet closed; it is simply waiting for a new generation of readers who are brave enough to look behind the curtain.
